

Atlas Copco

Experience Atlas Copco's brewery equipment

Whether you operate a microbrewery or mega brewery, Atlas Copco has the right equipment for your purposes. We are already a big name in air compressors to the brewing industry, and can also supply nitrogen generators, process cooling solutions, pipework, specialised filtration products for various stages of the brewing process, parts and service, from just one supplier to keep your brewing equipment running. This is why half of the world's beer producers have already chosen Atlas Copco as a supplier.

**Now it's your turn to find out what the Atlas Copco
brewery experience can bring to your brewery too.**

Whether you need oil-free compressed air or oil-injected, in large or small quantities, if your main concern is energy efficiency, a small machine to fit near the point of use, or a whisper-quiet noise level, Atlas Copco can match a compressed air solution to your brewery's requirements, with the perfect fit.

Are you currently buying bottled nitrogen gas? If so, you could reduce your nitrogen costs to one tenth by switching to an Atlas Copco onsite nitrogen generator. Don't have much space to house a new piece of equipment? That's not a problem, since our NGMs units have a footprint of only 0.25m² with low operating costs while offering an excellent return. If you are worried about the impact of making such a big change to your nitrogen supply, we would be happy to show you some examples of similar breweries who have made the switch and are pleased they did.

If you would like to complete your efficiency package, our new TCX industrial chillers might be the right choice for you! These chillers play a key role in many stages of the brewing process, maximising energy efficiency whilst offering the reliability and performance you demand from your water cooler.

Atlas Copco's process filters optimise your productivity, while protecting your process, products and consumers. Our portfolio of bags, capsules, cartridges and housings cover all your process filtration and purification needs, from the input of the raw materials through to the final product.
